

## Resource - Allocation Graph

- Deadlock can be described more precisely in terms of a directed graph called a system resource-allocation graph.
- This graph consists of a set of vertices  $V$  and a set of edges  $E$ .
- The set of vertices  $V$  is partitioned into two different types of nodes:  $P = \{P_1, P_2, \dots, P_n\}$ , the set consisting of all the active processes in the system, and  $R = \{R_1, R_2, \dots, R_m\}$ , the set consisting of all resource types in the system.

\* A directed edge from processes  $P_i$  to resource type  $R_j$  is denoted by  $P_i \rightarrow R_j$ , it signifies that process  $P_i$  has requested an instance of resource type  $R_j$  and is currently waiting for that resource.

\* A directed edge from resource type  $R_j$  to process  $P_i$  is denoted by  $R_j \rightarrow P_i$ , it signifies that an instance of resource type  $R_j$  has been allocated to process  $P_i$ .

\* A directed edge  $P_i \rightarrow R_j$  is called a request edge; a directed edge  $R_j \rightarrow P_i$  is called an assignment edge.

- We represent each process  $p_i$  as a circle and each resource type  $R_j$  as a rectangle.
- Since resource type  $R_j$  may have more than one instance, we represent each such instance as a dot within the rectangle.
- Note that a request edge points to only the rectangle  $R_j$ , whereas an assignment edge must also designate one of the dots in the rectangle.

The resource-allocation graph shown in figure below depicts the following situation:

- The sets  $P$ ,  $R$  and  $E$  :
  - $P = \{P_1, P_2, P_3\}$
  - $R = \{R_1, R_2, R_3, R_4\}$
  - $E = \{P_1 \rightarrow R_1, P_2 \rightarrow R_3, R_1 \rightarrow P_2, R_2 \rightarrow P_1, R_2 \rightarrow P_1, R_3 \rightarrow P_3\}$

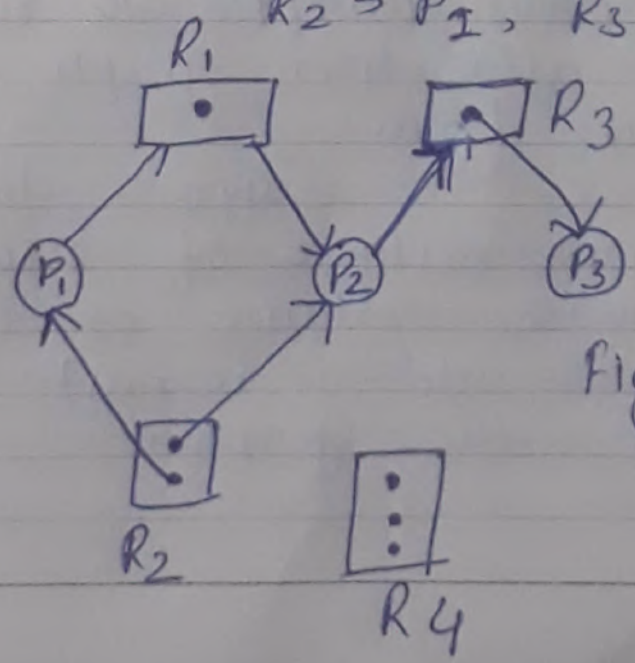

Fig: Resource-allocation graph.

- Resource instances :

- One instance of resource type  $R_1$ .
- Two instance of resource type  $R_2$ .
- One " " " " " "  $R_3$ .
- Three " " " " " "  $R_4$ .

- Process states :

- Process  $P_1$  is holding on instance of resource type  $R_2$  and is waiting for an instance of resource type  $R_3$ .

- Process  $P_2$  is holding on instance of  $R_2$  and on instance of  $R_2$  and is waiting for an instance of  $R_3$ .

- Process  $P_3$  is holding on instance of  $R_3$ .

- To illustrate this concept, we return to the resource-allocation graph depicted in previous figure.

Suppose that process  $P_3$  requests an instance of resource type  $R_2$ . Since no resource instance is currently available, we add a request edge  $P_3 \rightarrow R_2$  to the graph.

M	T	W	T	F	S	S
				1	2	3
4	5	6	7	8	9	10
11	12	13	14	15	16	17
18	19	20	21	22	23	24
25	26	27	28			

- At this point, two minimal cycles exist in the system:

$$P_1 \rightarrow R_1 \rightarrow P_2 \rightarrow R_3 \rightarrow P_3 \rightarrow R_2 \rightarrow P_1$$

$$P_2 \rightarrow R_3 \rightarrow P_3 \rightarrow R_2 \rightarrow P_2$$

Fig: Resource - allocation graph with a deadlock.

- Processes  $P_1$ ,  $P_2$ , and  $P_3$  are deadlocked. process  $P_2$  is waiting for the resource  $R_3$ , which is held by process  $P_3$ . Process  $P_3$  is waiting for either process  $P_1$  or process  $P_2$  to release resource  $R_2$ . In addition, process  $P_3$  is waiting for process  $P_2$  to release resource  $R_1$ .

Now consider the resource-allocation graph in this figure. In this example, we also have a cycle:

$$P_1 \rightarrow R_1 \rightarrow P_3 \rightarrow R_2 \rightarrow P_1$$

fig: Resource-allocation graph with a cycle but no deadlock.
